DETAILED ACTION

REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: None of the prior art teaches or suggests the claimed invention. While Lou et al. and Wu et al. each teaches the quantization **errors** in the **discrete cosine transform** domain achieve the smallest visual degradation. Embedding the watermark within the image by introducing **reduced** distortion into transformed coefficients provides the **robustness for the watermark detection without degrading the image quality**. Besides, the proposed method does not require the original image to detect the watermark; neither teaches or suggests adding the parameter combination with the least error and the second threshold (image robustness) to replace a DCT parameter of the subband image position in the embedded block when the least error is less than the first threshold (image distortion) and the series of the binary watermark image is one of 1 or 0; and subtracting the second threshold from the parameter combination with the least error to replace a DCT parameter of the subband image position in the embedded block when the least error is than the first threshold and the series of the binary watermark image is one of 1 or 0, as variously required by the claimed invention. The Examiner finds no reason or motivation to combine the above references in an obviousness rejection thus placing the application in condition for allowance.

2. Claims 1-15 are allowed

drawings.

4. Any comments considered necessary by applicant must be submitted on later than the payment of the issue fee and to avoid processing delays should preferably accompany the issue fee. Such submissions should be clearly labeled, comments on statement of reasons for allowance.

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Lou et al (Robust Image watermark based on hybrid transformation, IEEE 2003) discloses watermarking based on DCT.

Wu et al (US 6,285,775) discloses watermarked digital image described in the frequency domain including the DCT.

Hsieh et al (Image Refining Technique using Digital Watermarking, IEEE 2000) discloses the robustness of watermark depending on the parity bits of rearranged DCT coefficients in the lower frequency sub bands of quantized DCT .
